## Topic

## Background

## Population counts by age and sex

2006 and 2001 Censuses
Released by Statistics Canada, July 17, 2007

According to the 2006 Census, the median age in Nunavut was 23.1 years, the lowest in the country. The territory had the highest proportion of children aged 14 and under at $33.9 \%$ and the lowest proportion of people aged 65 and over at 2.7\%.

Nunavut's relative 'youth' is attributable to its high fertility rate, particularly among the Inuit population, and its lower life expectancy than in other provinces and territories.

From 2001 to 2006, the population in each province and territory has been aging. The proportion of people aged 65 and over increased between 2001 and 2006 in every province and territory, while the percentage of children aged 14 and under declined.

## Background

Out of the total Nunavut population of $\mathbf{2 9 , 4 7 5}, \mathbf{5 1 . 3}$ \% were males and $\mathbf{4 8 . 7 \%}$ were females according to the 2006 Census. In the country, only the three territories and Alberta had a higher number of males than females. As in any very young population, there are more males than females because more boys are born than girls, but the male-to-female ratio falls below 1 after a certain age because mortality is higher among males.

From 2001 to 2006, the population in each of the age groups shown in the table below increased except for children aged 5 to 9 years.

Background

## Detail

According to the 2006 Census, Kugaaruk, Igloolik, Hall Beach, Whale Cove, Arviat and Coral Harbour had the highest proportion of children aged 0 to 14. About 4 out of 10 people in these six communities were children aged 14 and under. On the other hand, Qikiqtarjuaq and Baker Lake had the highest proportion of seniors 65 and over at about $5 \%$. Iqaluit had the highest median age at $\mathbf{2 8 . 8}$ years. Almost three quarters of the population of the capital city were of working-age ( 15 to 64 years), the highest proportion in the territory.

Note: Data may not add to totals as a result of random rounding and the exclusion of the unorganized areas and settlements.

## Difference between Statistics Canada's census counts and population estimates

The census counts and the population estimates play key and complementary roles as sources of information on population.

The Census provides unique, detailed statistical data at a single point in time on the demographic, social and economic conditions of the population. The census tells us not only about Canada but about the cities, communities and people that make up each province and territory. Because the census measures such a wide range of standardized and nationally comparable statistics, it is a unique source of cross-classified data. For example, the census can provide information such as employment by industry and occupation. It can also provide socio-economic information about specific groups such as Aboriginal peoples, visible minorities and language groups. In general, studying trends over time is not affected by net census undercoverage to the extent that it does not vary much from one census to the next.

Population estimates are used to calculate the major federal transfers to the provinces and territories (for example, through such programs as Equalization, Canada Health and Social Transfer, the Health Reform Transfer and Territorial Formula Financing). The population estimates are adjusted for net census undercoverage, as even a small error in the estimates could result in a misallocation of millions of dollars. It is estimated that in 2006-2007, support through major transfers to provinces and territories will be approximately $\$ 62.1$ billion. The estimates also play an important role as population benchmarks in the production of current socio-economic indicators such as vital rates, unemployment rates and school enrolment rates. In addition, estimates are used to weight Statistics Canada surveys, including the Labour Force Survey, the Household Facilities Survey, the General Social Survey and the Survey of Labour and Income Dynamics.
